Work is split across multiple tools

Developers move between the coding app, command window, AI chat, and GitHub.

Each handoff loses information

Instructions and project context often have to be repeated.

People must still verify every change

AI-generated code requires human review before it is accepted.

**AI adoption is rising faster than
workflow control.**

One controlled workflow from task to approved code.

RxCode sends a task to the developer's chosen AI tool, shows every proposed change for approval, saves approved work to GitHub or GitLab, and allows progress to be monitored from mobile.

1

Describe the task

Developer enters the required change.

2

AI prepares the work

AutoPilot sends the task to the selected AI coding tool.

3

Review and approve

Developer inspects the changed files before accepting them.

4

Save and continue

Approved work is saved to GitHub/GitLab and can be followed from mobile.

AutoPilot is RxCode's task runner—it dispatches work and tracks progress.

Multiple AI tools

Human approval

Mobile visibility

PRODUCT DEMO

Start on Mac. Review from mobile. Approve before anything is saved.

Demo task: add a new model setting,
inspect the changed files, and approve
the update.

We start with HKUST developers, then expand to Hong Kong startup teams.

1 Global market benchmark

-  **150M+**
developers on GitHub
-  **US\$10–39**
monthly competitor pricing
-  **US\$18B**
annual addressable-seat proxy

(Note: Market benchmark, not forecast revenue.)

2 Initial reachable market

-  HKUST technical student community
-  Hong Kong startup engineering teams
-  Selected SME development teams

3 Initial serviceable objective

-  **100**
activated users
-  **1**
HKUST pilot cohort
-  **3**
SME design partners

Pricing logic

RxCode has not finalised public pricing. The team will test pricing against the current **US\$10–39** per-seat monthly market range during the SME pilot stage.

Why now

AI coding adoption is mainstream, but review, control and workflow management remain fragmented.

RxCode adds oversight across the AI tools developers already use.

Feature	RxCode	Cursor	GitHub Copilot	Devin Desktop
Supports multiple existing AI coding tools	Native	Partial	Limited	Limited
Human approval before accepting changes	Native	Native	Available	Partial
GitHub/GitLab workflow	Native	Limited	Native	Available
Mobile monitoring	Native	Not publicly confirmed	Not publicly confirmed	Not publicly confirmed
Publicly inspectable source code	Available	Not publicly confirmed	Not publicly confirmed	Not publicly confirmed
Built-in editor experience	Limited	Native	Native	Native

 A control layer—not another AI editor.

Our wedge

- 1

Keep existing AI tools

RxCode acts as a control layer rather than forcing one replacement tool.
- 2

Approve before accepting changes

Developers retain visibility and decision authority.
- 3

Continue across desktop and mobile

Progress can be followed without remaining at the workstation.

 Competitors are stronger in editor distribution and installed user base; RxCode focuses on cross-tool control and review.

The product is live; customer validation is still early.

1. Public GitHub and distribution evidence

263 public commits

28 public releases

Latest version: **v1.15.3**

macOS live

iOS TestFlight beta

2. Early user evidence

~30

cumulative beta users
(Team estimate)

21

seven-day website
active users
(Internal GA4 data,
4 Jul 2026)

Note: Early users were acquired through organic developer-community outreach.

3. Next proof points

Define activated user

Measure four-week retention

Track sessions per active user

Secure three SME
design partners

HK\$35,800 funds measurable product validation.

ROADMAP

BUDGET ALLOCATION

Budget group			HK\$
	Cloud infrastructure		12,000
	Product analytics and monitoring		4,000
	Security and privacy review		5,000
	HKUST user research and campus pilot		4,000
	Paid-search validation test		4,000
	SME pilot support		3,000
	Business registration		2,000
	Apple Developer Program		800
	Domain and hosting		1,000
Total			35,800

OUR OPERATING TEAM

Core operators covering product, engineering, growth, and commercialisation.

CORE OPERATING TEAM

Qiwei Li
Founder & CEO

- Shipped RxCode through 28 public releases.
- Owns product vision and technical execution.

 Full-time

William Yong
Co-founder & Growth Lead

- Leads HKUST launch and customer discovery.
- Owns campus acquisition and commercialisation.

 HKUST Student

Mitchell Ang
Product Lead

- Owns product requirements and pilot workflow.
- Responsible for user testing and prioritisation.

 HKUST Student

EXTENDED OPERATING TEAM / SPECIALIST SUPPORT

Nicole Ng
Strategy & Partnerships

Supports business strategy and partnerships.

 IBM — professional experience

Zilue Zhang
Operations & Commercialisation

Supports operations and commercialization execution.

 HKUST Alumnus

He Yifeng
Technical Architecture

Strengthens system architecture and technical scalability.

 Alibaba — professional experience

Help students and small teams adopt AI coding with human oversight.

1

HKUST students
(1 pilot cohort)

Practical training in supervised
AI-assisted development.

100

Early users
(100 activated users)

Measure onboarding, retention
and responsible usage.

3

SME teams
(3 design partners)

Test controlled AI workflows with
small development teams.

OPEN-SOURCE CONTRIBUTION

Publish one open-source onboarding guide
for responsible AI coding workflows.
